AQ6150 Series
Optical Wavelength Meter

Bulletin AQ6150SR-01EN
Recently, in order to enable the new optical networks for IoT or the next-generation communication “5 G”, WDM (Wavelength Division Multiplexing) technology has been widely used from backbone to access. New optical components and devices for such new technologies need to be tested to measure individual optical wavelengths with a higher accuracy.

Our extensive experience working with customers in the optical Test & Measurement Industry has enabled us to design the world's most reliable and versatile Optical Wavelength Meters. In fact, they feature specific technical characteristics that make them the most efficient and effective instruments for measuring devices and systems used in the most demanding applications of photonic technology.

Yokogawa’s AQ6150 Series can satisfy the specific test and measurement needs of R&D and manufacturing centers belonging to these demanding industries.

**Reliability** – The most trusted optical wavelength meters in the world, thanks to their unmatched measurement accuracy, robustness and proven quality.

**Technology** – Best in class, state of the art and high-precision instruments that keep pace with ever changing and fast evolving optical technology.

**Operability** – For more than 30 years our R&D and product specialist teams have been listening to the needs of users to continuously provide them with innovative and effective solutions for their measuring challenges.

### Standard/High Accuracy models

There are two models available, the ±0.2 ppm high accuracy model with improved wavelength accuracy (AQ6151B) and the ±0.7 ppm standard model (AQ6150B).

### Standard/Extended/Wide range type

- **Standard**: for telecom device testing from O to L-Band
- **Extended**: for CWDM transceiver testing
- **Wide range**: for pump laser testing

### Multi wavelength/Single wavelength type

You can choose between multi wavelength detection capable of simultaneous measurement of multiple wavelengths such as WDM signal or single wavelength detection, which is enough to characterize a transceiver module, LD chip or even the wafer level output.
2X Faster measurement speed*

For the production of tunable laser sources and tunable optical transceivers, high speed measurement and processing capability are required. The AQ6150 series can acquire, analyze and transfer a measurement to a PC within 0.2 seconds.

*Compared with our previous models.

Excellent wavelength measurement performance

High wavelength accuracy of ±0.2 ppm

There are two models in this series. The High Accuracy AQ6151B model offers an accuracy of ±0.2 ppm to meet the most demanding precision requirements. The Standard Accuracy AQ6150B offers a ±0.7 ppm accuracy for applications with less demanding requirements, at a more affordable price.

The real time correction feature utilizes a highly stable reference signal from the built-in wavelength reference light source in order to provide long-term stability for each and every measurement taken.

CW, modulated transceiver and optical filter measurement

The optical output of optical transceivers and optical transmission systems is modulated with a transmission frequency including 10 G and 25 Gbps. The built-In Optical Spectrum Analysis capability utilizing an FFT technique is required to measure the spectrum broadened by the modulated signal.

In addition to the regular CW light mode, the AQ6150 Series has a modulated light mode. The modulated mode analyzes the optical spectrum and discovers the center wavelength of the modulated light. This mode can also be used for the center wavelength measurement of optical filters such as a band pass filter, AWG and WSS.

Simultaneous measurement of up to 1024 wavelengths

AQ6150 series can measure up to 1024 wavelengths in a single input signal with a minimum separation of 5 GHz simultaneously, quickly, and accurately. This means it can meet testing needs in the development and production of WDM transmission system today and in the future as well.

The multi-wavelength measurement capability contributes to production efficiency and cost reduction in the production of single-wavelength laser devices as well, by combining multiple laser modules or optical transceivers using an optical coupler and measuring all the signals at once.

Delivering high performance even with low-power input signals

Equipped with an Auto Gain Control (AGC) function, the AQ6150 Series adjusts the gain of the electrical amplifier automatically based on the input signal power. This helps maximize wavelength accuracy and measurement speed even if the input signal power is as low as −40 dBm.
Improve productivity

Increase throughput with high speed measurement

For the adjustment and characterization of tunable laser sources and tunable optical transceivers requiring hundreds of wavelength measurements per device, high-speed measurement and processing capability are crucial for improving the production throughput. Both models can acquire, analyze and transfer a measurement to a PC in less than 0.2 seconds! This is 2 times faster than our AQ6150 or AQ6151 model, thus vastly improving production throughput. In the Repeat measurement mode, the AQ6150 series can collect 10 measurements per second, making it extremely useful when adjusting a device while monitoring the wavelength in real time.

Reduce lifetime ownership costs

With the conventional wavelength meters, the high failure rate of the wavelength reference light source and its high replacement costs have been a major contribution to the overall costs of ownership during the product life cycle, not to mention the costs generated by the downtime itself. One of our key targets for product design was to address and mitigate as much as possible these issues. We achieved this goal in a multi-dimensional approach as represented graphically in the below scheme.

- Extending the typical lifetime (MTBF) of the light source (Maximize Horizontal scale).
- Reducing the replacement cost (Minimize Vertical scale).

Upgrade the test system with ease

Easily build an automated measurement system using a remote control interface, ETHERNET or GP-IB. The remote command set complies with the commonly accepted SCPI industry standard command set for programmable instruments. Thus, the existing measurement system can be easily upgraded without having to change the measurement program if Yokogawa AQ6140 series or another SCPI compatible optical wavelength meter is already in use.
Choose your preferred view mode

**Single wavelength mode**

The single wavelength mode displays the wavelength and power of the highest peak or an arbitrary peak using large easy to read numbers. This allows the values to be easily read even if the unit is placed at the top of the test stand.

![Single wavelength mode example](image1)

**Multi wavelength mode**

The multi wavelength mode displays a list of wavelengths and power of multiple peaks with the wavelength and power of the highest peak or an arbitrary peak on top of the list. There is also a mode to show the list only to maximize the number of channels shown on the screen.

![Multi wavelength mode example](image2)

**Delta wavelength mode**

The delta wavelength mode calculates and displays the difference between a reference peak and the other peaks in terms of wavelength and power. This mode helps determine the peak spacing.

![Delta wavelength mode example](image3)

**Grid mode**

Displays the deviation between a set grid wavelength and a measured wavelength which is within a set search area centering the set grid wavelength.

![Grid mode example](image4)

**Various measurement units**

Choose from any of the following measurement units.

- Wavelength: Wavelength (nm), Frequency (THz), or Wave Number (cm\(^{-1}\))
- Power: dBm, mW, or µW

**Optical spectrum view**

The AQ6150 series can display an optical spectrum waveform obtained from a Fast Fourier Transform (FFT) algorithm. It allows for determining test conditions and for troubleshooting an error in the measurement while confirming the actual spectrum.

When a peak is selected on the list, the peak automatically shifts to the center of the optical spectrum view, making viewing easy and convenient.
No programming required with built-in analysis functions

The AQ6150 series is equipped with automatic measurement and analysis functions. These functions save valuable time and resources by creating/validating remote control and analysis programs.

**Drift analysis**

The drift analysis measures the variation of wavelength and power for each peak over time by repeating the measurement. It obtains maximum value (MAX), minimum value (MIN), and variation (MAX-MIN). This function is useful for long-term stability testing and for evaluating the temperature dependency of lasers.

**Fabry-Perot laser analysis**

The evaluation parameters of a Fabry-Perot laser can be analyzed and displayed instantly from the measured optical spectrum. Results include:

- Center wavelength, total power, spectral-width (FWHM), mode spacing, etc.

**Average measurement**

The Average measurement obtains an average wavelength and power for each peak by repeating the measurement. This function helps reduce uncertainty of measurement for a modulated signal or unstable signals.

**Data logging function**

Up to 100001 points of measurement data per channel can be stored and displayed in tabular or graph form. It facilitates the long-term stability test and temperature cycle test.
User-friendly interfaces

Proven design and operability

The AQ6150 series’ screen design and intuitive operability is inherited from YOKOGAWA’s best-selling optical spectrum analyzer. This interface has been proven by a vast population of users on a global scale in areas such as R&D testing and troubleshooting in manufacturing.

USB ports

- Compatible with USB data storage devices, mouse and keyboard.
- File function enables users to save data and screenshots to the internal memory or USB storage to use when creating test reports. Screenshots can also be saved by simply pressing the Print Screen button (PRT SCN) located on the front panel.

Data access through LAN

The standard LAN port allows convenient access to files stored in the internal memory as well as ability to remotely update the firmware from a PC.

Direct operation with mouse

- Using a USB mouse makes it easy and intuitive to change measurement conditions, execute an analysis, and modify the optical spectrum view.
- In the optical spectrum view, the waveform view area can be zoomed and shifted by a simple click and drag. The peak threshold line, threshold for peak detection, can also be moved in the same manner.
Applications

WDM transmission systems

In order to meet the rigorous demands of current and next generation communication networks, developers are constantly challenged to improve the efficiency and capacity of the transmission system. In response to these challenges, various techniques have been developed, such as minimizing channel spacing, maximizing the number of channels and transmission rate, using sophisticated modulation schemes, etc.

In WDM transmission system testing, high wavelength accuracy is required for testing the system’s internal circuit boards such as laser modules and optical transceivers as well as the final output signal of the system, which may involve:

- Simultaneous measurement of multi channel and narrow spacing WDM system
- Precise adjustment and inspection of laser sources
- Measurement of modulated signals

Calibration of test systems

Due to the high accuracy of the AQ6150 series, it can be used for precision wavelength calibration applications including:

- Calibration of optical spectrum analyzers
- Calibration of DFB lasers for optical amplifier test system.
- Calibration of tunable lasers for passive component test systems.

Lasers/optical transceivers

Testing of optical components used in WDM transmission systems such as laser devices, laser modules, and optical transceivers also requires high wavelength accuracy. These applications may include:

- Precise adjustment and inspection of tunable lasers
- Modulated signal measurement of optical transceivers and transponders.
- Measurement of all channels of 40 G and 100 G optical transceivers with WDM technology.

NOTE:

The AQ6370 Series Optical Spectrum Analyzer is recommended for measuring Side Mode Suppression Ratio (SMSR) of lasers and Optical Signal to Noise Ratio (OSNR) of WDM transmission systems.
Interfaces

1 Display
Displays measured waveforms, measurement conditions, measured values, etc.

2 OPTICAL INPUT
Connect the optical input signal here.

3 Soft key
Control the functions that are assigned to soft keys, which appear on the right of the LCD display.

4 USB port
Connect a USB storage medium, USB mouse, or USB keyboard.

5 FUNCTION
Set all features including measurement, setup, and display.

6 DATA ENTRY
Enter measurement condition parameters and labels.

7 VIDEO OUT
Video signal (VGA) terminal
Use this terminal to view the instrument screen on an external display.

8 GP-IB connector
Use this connector to control the instrument from a PC.

9 ETHERNET port
Use this port to connect the instrument to a network.
(10/100/1000BASE-TX)

10 USB port
Connect a USB storage medium, USB mouse, or USB keyboard.

Principle

Michelson interferometer
Generate interference by changing the optical path length difference between the fixed mirror and the movable mirror. Then detect the interference signal with the optical receiver.

Fast Fourier transform (FFT)
Convert the interference signal (interferogram) into the optical spectrum waveform.

Fast data processing
Analyze the given optical spectrum waveform. Then output the wavelength and power data of the input signal.

Real-time wavelength correction
Correct the measurement error by simultaneously measuring the interference signal of the reference wavelength while measuring the input signal.
