Explanation of the Functions

The 16-bit Digital Input Terminal Box is a terminal box used to convert the input signal for the 32-Bit Digital I/O Module WE7262. The signals up to ±35 V that are applied to the input section of this instrument are converted to TTL signals and input to the WE7262. The input section is insulated from the case and the I/O ports of the WE7262. Each input bit is also insulated from the others.

2 V or 6 V (approximate values) can be selected for the threshold of each input bit by changing the wiring of the input section.

Up to two terminal boxes can be connected to the WE7262. In addition, this terminal box can be used with the 16-bit digital output terminal box (Model: 707824) (Either of the WE7262 ports, 1 or 2, can be used).

The counter function of the WE7262 cannot be used on the port to which this terminal box is connected. This terminal box also does not work with the 16-Bit Digital I/O Module WE7261.
Connection Example

On the input terminal, there are three terminals, L, H1, and H2, for each bit. The thresholds for signals applied across the L and H1 terminals and across the L and H2 terminals are approximately 2 V and 6 V, respectively. Select H1 or H2 according to the output voltage of the instrument being measured and connect them as shown in the following figure.

**Connection Example for Voltage Signal (when H level ≥ 2.5 V)**

![Connection Diagram for Voltage Signal](image)

**Connection Example for Contact Signal (when H level ≥ 8 V)**

![Connection Diagram for Contact Signal](image)

The input to WE7262 is H when the contact is turned ON.

**WARNING**

Use input signal wires that have reinforced insulation that corresponds to the voltage (input voltage and common mode voltage) being used. If the wire’s withstand voltage is not adequate, it can cause electric shock.

**Relationship between the operation voltage and the wire’s withstand voltage (based on JIS C 1010-1)**

Make the stripped section of the wire less than or equal to 6 mm and insert it securely into the terminal box. Do not let any part of the twisted wire come in contact with the case or other input terminals. Electric shock may result if the wire is in contact with other parts.

**CAUTION**

- Applying a voltage exceeding the maximum input voltage can damage the input section.
- Do not apply voltage across H1 and H2. It can damage the input section.
- Do not apply voltage across H1 and L and across H2 and L of the same terminal simultaneously. It can damage the input section or cause malfunction.
- When attaching the terminal box to a wall, for example, by using the screw holes located on the bottom side, use screws of length 3 mm or less (from the surface of the terminal box inward). Using longer screws can damage the internal circuitry.

Opening and Closing the Input Terminal Box

As indicated in the following figure, remove the four screws holding down the upper cover of the input terminal box, and remove the upper cover.
Terminal Arrangement
The input terminal is of clamp type, and the terminal arrangement is as follows.
The threshold varies depending on the terminal being used.
Across H1 and L : Approx. 2 V
Across H2 and L : Approx. 6 V

Connecting the signal wires
To connect the input signal wire to the clamp terminal, loosen the clamping screw, insert
the wire into the opening, and tighten the clamping screw. Be sure that the input signal
wires pass through the cable clamp. The cable clamp can be opened and closed.

After connecting the input signal wires, place the upper cover over the input terminal box
and tighten the four screws to secure the upper cover.
Connecting the Terminal Box to the Module

Precautions when connecting to the module
- Use the cable that is included in the package to connect the terminal box to the WE7262. To secure the connection, make sure to tighten the cable's connector screws. After connection, the terminal box, the WE7262, and the measuring station will be at the same electric potential.
- When using a cable other than the one included in the package, use a 25-pin D-sub connector (male) for the cable connector. Connect the wires to the same connector pins on each end of the cable. The thickness of the wire must be AWG28 and the cable length less than or equal to 10 m. To suppress the influence of electro-magnetic interference, use a shielded cable, and perform other appropriate shielding measures.

Pin Assignments of the Connector on the Module Side
The 25-pin D-sub connector of the terminal box (female) is connected to the I/O port on the front panel of the 32-Bit Digital I/O Module WE7262 using the connection cable. The pin assignments of the connector on the module side are as follows.
- Signal and Function
  - IO00 to IO15: Digital input signal
  - GND: Ground
  - VPW: External power supply (+5V)
  - NC: Not used (no connection)
